

Next GM V2 Booking Consequence Audit

Notes Edition - converted from the Codex audit response. Generated for annotation; no app source files were modified.

Audited workspace: /Users/vbahmad/Documents/AI/Next GM V2 Sandbox
Date: May 25, 2026
Verification: npm exec tsc -- --noEmit passed; npm test -- --run passed with 21 files and 115 tests. npm run build was intentionally skipped because Vite writes dist, conflicting with the audit-only/no-file-changes constraint.

1. Executive Summary

The booking system is partially consequential and materially real, not cosmetic. Player choices flow through currentShow into deterministic scoring, wrestler fatigue, morale, momentum, injuries, title changes, rivalry movement, finance reports, social posts, Week Review, Advance Week, and localStorage persistence.

The core spine exists, but it is uneven. The deepest real simulation lives in src/game/scoring.ts::runShow. Several player-facing panels are derived readouts that imply more systemic depth than actually exists. Finance, office pressure, brand pulse, IWC mood, title scene pressure, and PLE readiness are useful, but much of that layer is diagnostic or read-only rather than independent simulation.

Area	Estimate	Blunt read
Booking consequence completeness	72%	Real spine exists; several systems are partial/read-only.
Simulation credibility	70%	Deterministic and stateful, but centralized and heuristic.
Player-facing causal clarity	62%	Results explain many effects; Week Review under-surfaces some generated detail.
Week-to-week compounding readiness	74%	Fatigue, morale, momentum, injuries, rivalries, titles, money mostly carry forward.
Test confidence	61%	115 tests pass, but consequence-spine contract coverage is still incomplete.

2. Repo Reality Check

Item	Reality
Stack	React 19, TypeScript, Vite, plain CSS, localStorage, no router/backend/db/Tailwind per AGENTS.md.
Main orchestration	src/App.tsx, about 6.5k lines; still owns many mutation helpers.
Booking UI	src/booking/BookingScreen.tsx and IntegratedSegmentComposer.tsx.
Core simulation	src/game/scoring.ts::runShow.
Week advance	src/game/advanceWeek.ts::advanceGameWeek.
Persistence	src/gameStorage.ts localStorage save/load helpers.
Read-only context	src/game/gameContextReads.ts.
Architecture risk	App.tsx and styles.css are still large; source-of-truth game mutation leaks into React orchestration.

Docs read: AGENTS.md, DESIGN.md, finished-product-goal, dynasty-booking-north-star, playable roadmap, lean validation strategy, UI doctrine, visual design contract, player-facing UI QA checklist, broadcast command-center style guide, and related booking/market/tag/title/stipulation/season planning docs.

3. Booking Input Map

Booking input	Source	State/data shape	Affects sim?	Notes
Segment type	types.ts SegmentType; matchFormatCatalog.ts	Segment.type	Yes	Drives validation, score profile, fatigue, recap, title eligibility.
Match format	matchFormatCatalog.ts	segmentCatalogId, min/max participants	Yes	Singles, tag, triple threat, fatal 4-way exist.

Booking input	Source	State/data shape	Affects sim?	Notes
Promo/angle/contract/open challenge	matchFormatCatalog.ts	Catalog option fields	Yes	Non-match types affect score/fatigue/context; Open Challenge resolves opponent at run time.
Selected wrestlers	IntegratedSegmentComposer.tsx ; App.tsx::toggleParticipant	Segment.participantIds	Yes	Main input for score, fatigue, morale, injuries, records, finance draw.
Manual winner/booked finish	IntegratedSegmentComposer.tsx ; scoring.ts::getSegmentWinner	Segment.winnerId	Yes	Player-authored outcome, not prediction; adds booked-finish production cost.
Championship attachment	App.tsx::setSegmentChampionship; scoring.ts::resolveTitleMatch	Segment.championshipId	Yes	Can cause title changes, defenses, history, stat fallout.
Rivalry attachment	App.tsx::setSegmentRivalry; scoring.ts::resolveRivalrySegment	Segment.rivalryId	Yes	Moves heat, freshness, history.
Stipulation	App.tsx::setSegmentStipulation	Segment.stipulationId	Yes	Adds score, fatigue, rivalry, cost, social effects.
Runtime/order	BookingScreen.tsx::moveSegment; scoring.ts::resolveSegmentRuntime	durationMinutes and array order	Yes	Affects overrun, fatigue, finance, open challenge seed/index.
Difficulty	types.ts; difficulty.ts	game.difficulty	Yes	Affects pressure, injury risk, CPU/market tuning.
Roster availability	bookingUtils.ts; scoring.ts::isValidSegment	injury/rest flags	Yes	Major injuries and protected rest block booking.
CPU rival inputs	cpuRivalLoop.ts	rivalBrands hidden state	Yes	Player exact card affects rivals mainly through final show score/show type.

NOTES

4. Full Consequence Chain Map

Consequence	Status	Source	Carries?	Notes
Fatigue	Fully wired	scoring.ts::getSegmentFatigueGain; advanceWeek.ts	Yes	Strong booking consequence.
Morale	Fully wired	scoring.ts::updateWrestlerPressure	Yes	Booked/rested/underused/overused/injured all matter.
Momentum	Fully wired	scoring.ts::scoreSegment; advanceWeek.ts	Yes	Segment scores and title stat fallout move it.
Audience heat/trust/popularity	Partially wired	types.ts; scoring.ts; titleStatFallout.ts	Yes	Heat/trust move more broadly than popularity.
TV-time/overuse/underuse	Partial/full mix	scoring.ts; rosterContextReads.ts	Yes	Counters are real; many labels are derived.
Injuries	Fully wired	injury.ts; scoring.ts::evaluateInjuries	Yes	Deterministic; major injuries block future booking.
Segment/show score	Fully wired	scoring.ts::scoreSegment/runShow	History	Core consequence engine.
Social/IWC	Partial/full mix	social.ts; socialReads.ts	Posts persist	Posts grounded in resolved data; mood is derived.
Rivalry heat/freshness	Fully wired	scoring.ts::resolveRivalrySegment; advanceWeek.ts	Yes	Attached beats, PLE payoff, stale decay.
PLE readiness	Read-only derived	gameContextReads.ts	Recomputed	Advisory, not simulation.
Titles/history	Fully wired	scoring.ts::resolveTitleMatch/resolveTagTitleMatch	Yes	Title changes and defenses persist.
Title scene pressure	Read-only/partial	gameContextReads.ts	Recomputed	Mostly diagnostic.
Finance report/money	Report/full mix	finance.ts::generateFinanceReport	Yes	Show revenue/cost/profit real; payroll/market cost claim appears overstated.
Office pressure	Partially wired	market.ts::evaluateOfficeMandate; advanceWeek.ts	Yes	Indirect through money/result/ratings.
CPU rivals	Fully wired but summarized	cpuRivalLoop.ts	Yes	Hidden deterministic sim; exact causes only summary-level.

Consequence	Status	Source	Carries?	Notes
Week Review	Partially wired	weekReviewScreenReads.ts; WeekReviewScreen.tsx	N/A	Model richer than rendered screen.
Persistence	Fully wired	gameStorage.ts	Yes	localStorage snapshots carry GameState.

NOTES

5. Implemented vs Read-Only vs Placeholder

Fully wired: booking to runShow; segment score, recap, runtime, overrun; fatigue/morale/momentum/TV-time; injuries and booking blocks; title changes/defenses/history; rivalry heat/freshness/history; deterministic CPU weekly results; localStorage persistence.

Partially wired: finance, office trust/reputation/mandates, fan sentiment, Week Review. Finance mutates money and creates reports, but active payroll/market transaction integration is not clearly present in the inspected weekly finance formula.

Read-only derived context: PLE readiness/build pressure, title scene pressure, rivalry timing snapshot, Living World Pressure, GM desk reads. These are useful read models, not independent simulations.

Stale or overstated docs: tag planning docs are stale against current tag match/title code; stipulation planning language is stale if read as current; AGENTS finance language appears stronger than inspected finance implementation.

6. Causal Explanation Audit

Strong: Results segment reel connects booking to score, winners/losers, title notes, rivalry notes, stipulation notes, fatigue and momentum. Headline fallout prioritizes title changes, injuries, Open Challenge reveals, rivalry moments, and best segment. Social posts are grounded in resolved result data. Finance report uses resolved show score, runtime, title matches, roster draw, and production costs.

Weak: Week Review model creates useful story/roster/finance/rival data, but the current screen does not surface every generated explanation. Office pressure is legible but causal chain is indirect. Brand pulse and IWC mood are derived summaries rather than durable audience state.

Pre-show spoiler audit: no hard violation found. Open Challenge opponent is hidden as ????. Booking shows current risk, eligibility, planned cost, card readiness, and context, not predicted grade/social/revenue/title result. Manual winner is player-authored agency, but wording should stay careful.

7. Determinism and Integrity Audit

Area	Finding
Core show simulation	Deterministic; runShow uses deterministic scoring/helper seeds, not Math.random.
Open Challenge	Deterministic reveal at run time.
Injuries	Deterministic thresholds and seeds.
CPU rivals	Deterministic hash-based simulation.
Social posts	Core posts deterministic.
Random/time usage	Date.now used for segment/event IDs; saved cards are deterministic once IDs exist, but recreated equivalent cards can seed differently.
Persistence	localStorage save layer exists; random save IDs/timestamps do not affect gameplay math.
External calls	Optional post-show AI commentary path exists and can append social commentary if configured.
Boundaries	Pure logic is mostly in src/game, but App.tsx still owns many mutation helpers.

8. Week-to-Week Compounding Audit

State area	Persists?	Where updated	Risk/gap
Fatigue	Yes	scoring.ts and advanceWeek.ts	Strong.
Morale	Yes	scoring.ts::updateWrestlerPressure	Strong.

State area	Persists?	Where updated	Risk/gap
Momentum	Yes	scoring.ts and advanceWeek.ts	Strong.
Injuries/recovery	Yes	scoring.ts::evaluateInjuries; advanceWeek.ts::recoverWrestlerInjury	Strong.
TV-time	Yes	scoring.ts::updateWrestlerPressure	Strong.
Rivalries	Yes	scoring.ts and advanceWeek.ts	Strong.
Championships	Yes	scoring.ts title resolvers	Strong.
Money/finance	Yes	finance.ts	Report real; payroll gap.
Office pressure	Yes	market.ts and advanceWeek.ts	Indirect causality.
Social/IWC	Posts yes; mood derived	social.ts and socialReads.ts	Mood is not independent state.
CPU rivals	Yes	cpuRivalLoop.ts and advanceWeek.ts	Strong but summarized.
Season history	Partial/yes	advanceWeek.ts::startNextSeason	End-to-end UI not deeply audited.
Week Review CTA label	Display bug	weekReviewScreenReads.ts and WeekReviewScreen.tsx	Hardcoded 12 despite 50-week season.

NOTES

9. Test Coverage Audit

Existing verification: typecheck passed. Vitest passed: 21 files, 115 tests. Current tests cover several helpers and mechanics, but the full consequence spine is not yet proven as a contract.

Missing tests: booking changes fatigue/morale correctly; overuse/underuse; deterministic injuries; rivalry movement; title restrictions; finance reports from resolved data; payroll/market cost expectation; social/IWC from resolved outcomes; Week Review surfaces fallout; Advance Week carries state; legacy saves load; no pre-show spoiler regressions.

10. Top 10 Risks

1. Finance claims are stronger than code: weekly report does not clearly charge active payroll/market transaction costs.
2. Week Review has a real season-cadence display bug: hardcoded 12 despite 50-week season.
3. Too much mutation logic still lives in App.tsx.
4. Week Review underuses its own generated model.
5. Read-only panels can imply deeper simulation than exists.
6. Determinism depends partly on generated IDs.
7. Optional external AI commentary breaks the pure local/deterministic mental model after show resolution.
8. Manual winner is powerful but delicate; it needs wording guardrails.
9. CPU rivals are systemic but not very legible.
10. Tests do not yet prove the entire booking consequence spine.

11. Recommended Next Implementation Slices

Slice	Goal	Likely files	Validation	Player-facing gain
Consequence Spine Contract Tests v1	Prove booking -> result -> fallout -> advance carryover.	scoring tests, advanceWeek tests, smoke tests	Small Behavior	Confidence that choices actually matter.
Finance Causal Ledger Clarification v1	Make show costs/revenue/ payroll/market pressure honest.	finance.ts, finance reads/tests	Small Behavior	Clearer why money changed.
Week Review Truth Surface v1	Render most important already-computed fallout.	weekReviewScreenRead s.ts, WeekReviewScreen.tsx	UI-only or Read-only context	Better after-action clarity.
No-Spoiler Booking Guard Tests v1	Assert Booking never exposes predicted fallout.	src/booking/* tests	Read-only context	Trustworthy booking screen.
